Background

- ❖ 2010 census reported 3.2 million Asian Indians, a doubling from the previous census
- ❖ Most rapidly growing age group in America is above 65 years
- ❖ Paucity of data about beliefs and attitudes of older Indian Americans
- ❖ Providers should be familiar with their patients' historical experiences and current perspectives

Aim

- ❖ To study a group of Indian American seniors living in New York City to understand their attitudes toward health care

Methods

- ❖ Designed a guide to assess attitudes toward medical care
- ❖ Categories of interest: perceptions of medical care, quality of care, screenings and perceptions of healthcare in America
- ❖ Conducted 2 focus group discussions in English for Indian American seniors attending centers in Queens, New York.
- ❖ Interpreted using qualitative data analysis methods

Results

Participants	Total	Male	Female
	23	7	16
Age group in Years	56 to 86 (Mean = 69)		
Education level	10 th Grade to Graduate		
Years of Immigration	1970 to 1992		

Attitudes Towards Healthcare

- ❖ Reliance on non-allopathic forms of medicine, such as homeopathy, Ayurveda or herbal home remedies
- ❖ Majority utilized allopathic medicine, but often as a second line
- ❖ Only 6 participants believed it is important to have a primary care doctor
- ❖ Correlation between family history of chronic or malignant conditions and a propensity to seek preventive health care
- ❖ 35% (8) recalled undergoing at least one form of screening

Barriers to Healthcare

- ❖ Paperwork
- ❖ Discrimination
- ❖ Communication
- ❖ Provider gender preference only for gynecology
- ❖ Affordability: not qualifying for Medicaid

DISCUSSION

- ❖ Behaviors and attitudes from India carry over despite long term residency in America
- ❖ Widespread use of Indian complementary medicine continues decades after immigration
- ❖ Knowledge and utility of preventive health care were poor amongst this population despite a high level of education
- ❖ In order to increase compliance with preventative measures, health-care providers need to proactively dispel misconceptions
- ❖ Indians are the highest earning ethnic group in America; yet, cost remained a barrier to healthcare
- ❖ Communication was cited as a barrier despite our participants' command on English
- ❖ No race or gender preference expressed for primary care providers

FUTURE RESEARCH

- ❖ Investigating the use of complementary and alternative medicines
- ❖ Elucidating barriers to obtaining health care
- ❖ Education on preventive health seeking behaviors
